3D Modeling

3D modeling schemes provide us with a unique simulation image of the lighting fixtures arrangements, distribution, and types inserted in the project, which provide the client with project proposal contacting a pre overview, and expected arrangements for the real project that indicates how the project, and the lighting distribution will be, hence some preferred modern modification could be made before electrical erections Using software advanced programs, what's more, our well educated engineering team, Dura Group now can provide and create solutions for the new project through 3D schemes project modules that show the distribution of the lighting fixtures in the different areas of the project according to each area serving application.

3D scheme project module helps our unique clients designing their lighting fixtures infrastructure and layout, beside selecting the proper lighting luminaire to the detailed solicitation As well studying the outline drawing of the project we can recommend the type of the lighting fixtures used in addition to the number of luminaire for each explicit location.

The products recommended for the project are arranged, developed and inserted in tables showing the products types and ranges used in addition to the expected number of each product to be able to formulate the project's bill of quantities.
